Agricola: All Creatures Big and Small simple solo variant v1.1

Setup:
Remove 9 fences
Set up the Stall/Stable stack and any 4 special buildings (expansions or the Big Box edition add more).

You will need a 20-sided die (D20) to roll for which action spot the bot workers will choose. Action spot numbers start at the upper left corner of the board, with the Starting Player Token +1 Wood location being number 1. Special buildings are 17-20. Action spot numbers read right to left, then to the leftmost spot of the next row down. You can write numbers on the action spaces themselves, put mini post-it notes on the board, or I've also written a list of the action spaces available on this same file page on BGG. After a game or two I found it to be fairly easy to start memorizing the numbers for the action spots.

On the bot's turn, roll the D20 to determine which space their worker will occupy. Re-roll for already occupied locations until a new number is rolled.

Alternatively, you can print a bot deck of 20 cards depicting each action space or simply numbered 1-20, shuffle and draw from this deck to determine the bot's moves. If the bot draws a card for an action spot that is already occupied by one of your workers, then place the bot worker in the next available action spot to the right (or numerically ascending).

The bot does not have a farm board, build buildings, or build fences, they only block action spots for the round, collect fences, and clear the accrued resources back to the supply for the action spots they land on.

The bot does not collect resources or animals when they choose an action spot that has resources or animals, but returns them to the supply instead. The bot does collect fences and extensions when landing on the appropriate space (they are removed from the game, and scored in the higher difficulty modes).

Easy mode: The player always goes first, the bot does not earn points (beat your own score mode).

Normal mode: Starting player alternates between the player and the bot each round. If two fences are left on the Fence location at the end of the round, the bot takes them and an extension (they are removed from the game). The bot does not earn points (beat your own score mode).

Hard mode: The player always goes second. If one fence is left on the Fence location at the end of the round, the bot takes it and an extension. The bot earns the point values for every building collected and +2 points for each fence collected (including their starting fences) and +2 for each extension collected.

Farmageddon mode: The player always goes second. If one fence is left on the Fence location at the end of the round, the bot takes it and an extension. At the beginning of the last round the bot takes a fence from the Fence location and an extension (without placing a worker). The bot earns the point values for every building collected, any Stalls collected are flipped to the Stable side and point value. They earn +3 points for each fence (including their starting fences) and +3 for each extension collected.

Solo mode designed by Sam Carpenter (BGG: LightTheWay) in 2025 (updated 2026).
